Screen	Script
1	You've finished your latest PCB design. You've generated your Gerber files. Everything's ready to go to production… **Or is it?** Sure, you've inspected your CAD drawings for errors. But not everything's visible in CAD. Before you send it off, wouldn't you like to have another look… from another perspective… through a different set of eyes which would let you see your board just as it will look when it's manufactured… and even *see between* the layers?
2	Now you can... with ZofzPCB, the FREE 3D Gerber file viewer. ZofzPCB creates a highly realistic 3D rendering of your PCB, directly from your Gerber files. And it provides full 3D navigation of your design, via intuitive mouse and keyboard controls.
3	You can **pan and tilt** the camera… **Move forward... back... right... and left**, to find design features you want to examine more closely… **Center the scene** on your cursor with a click of the left mouse button… so you can **zoom in** for a closer look. And **rotate the board in any direction** you choose… so you can get just the perspective you need.
